Explore PoolQC

PoolQC has different levels in train and test. Let's investigate it

```
counts <- table(train$PoolQC)  
barplot(counts)
```

```
counts
```

```
##
##  Ex  Fa  Gd none
##   2   2   3 1453
```

```
counts <- table(test$PoolQC)
barplot(counts)
```

```
counts
```

```
##
##   Ex   Gd none
##    2    1 1456
```

Since there are not a lot of samples, we will just collapse PoolQC into Yes or None. Also, we will remove predictor PoolArea from the final model because we will see below that the rship with SalePrice doesnt look linear at all

```
#Collapse PoolQC into yes or none
train$PoolQC = fct_collapse(train$PoolQC, yes=c("Ex", "Fa"))
test$PoolQC = fct_collapse(test$PoolQC, yes=c("Ex", "Gd"))
```

Numerical Variables

```
#library(purrr)
train_num <- train %>% keep(is.numeric) %>% head()
num_cols <- unlist(lapply(train, is.numeric)) # Identify numeric columns
train_num <- train[ , num_cols] # Subset numeric columns of data

Make Predictions

Make predictions for the test data

```
predicted.SalePrice2 = exp(predict(fit_aic, newdata=test))
```

```
## Warning in predict.lm(fit_aic, newdata = test): prediction from a rank-deficient
## fit may be misleading
```

Preparing the dataset with the predicted sale prices for the test data:

```
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice2)
write.csv(file='D:\\Datos\\Documents\\Development\\R\\Advanced Statistics\\Project 1 House Prediction\\',
```
